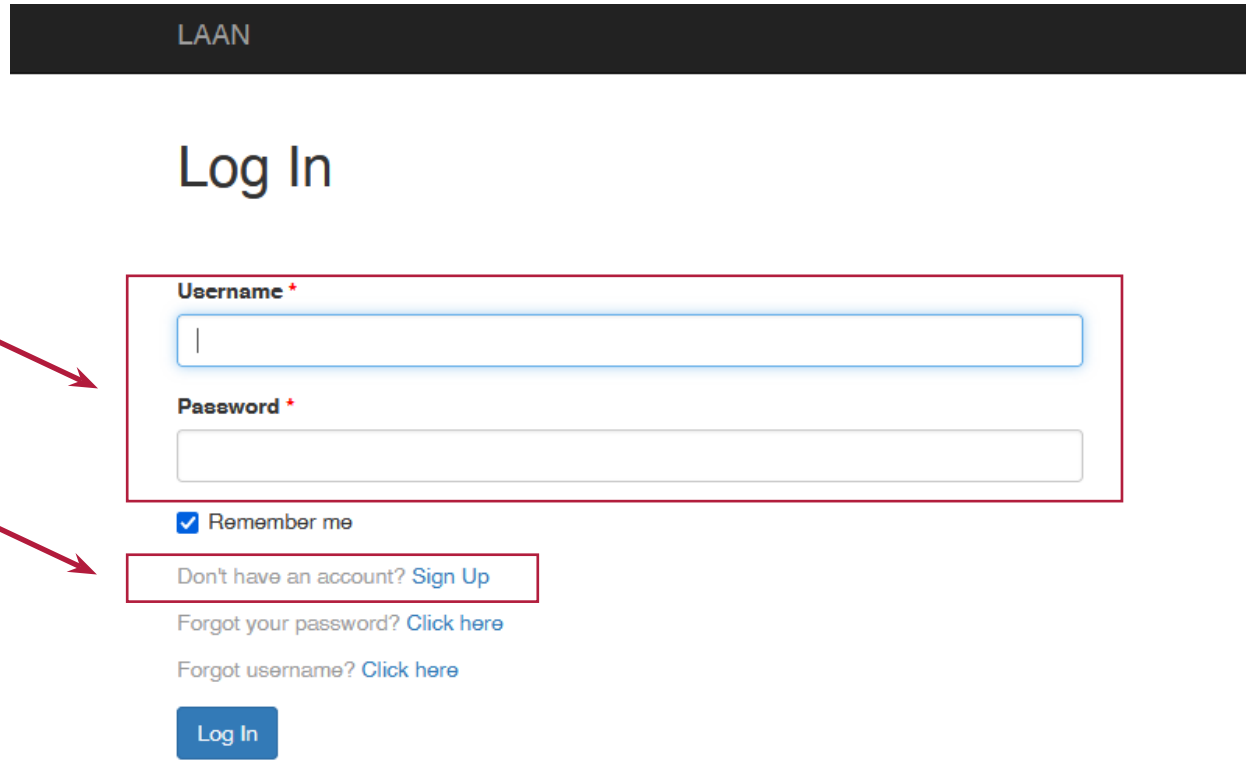
HOW TO SUBMIT AN ABSTRACT

1

Access the platform page by clicking on the "ONLINE SUBMISSION SYSTEM" button located on the Workshop page of the SINS website

If you are a SINS Member login the Online Submission System using your member Username and Password

If you are not a SINS member or do not already have an active account on the SINS portal, create a new account by filling out the registration form

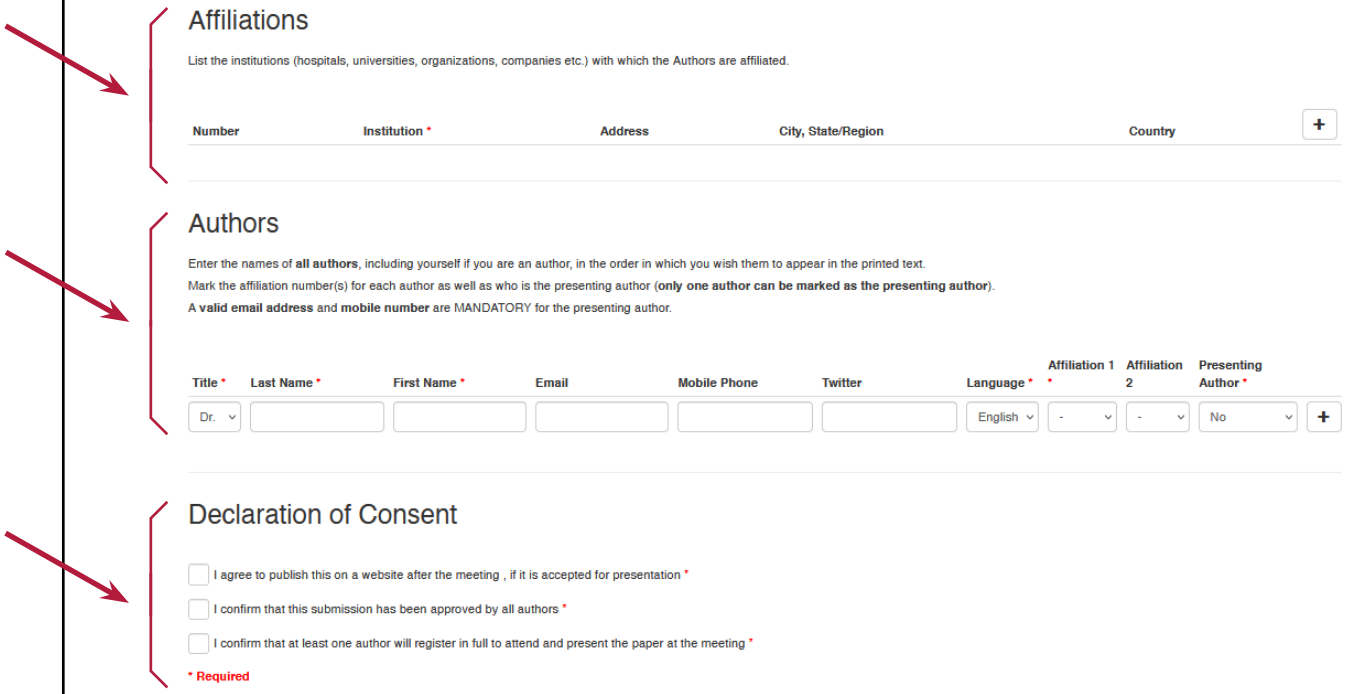


2

Affiliation(s)
enter the Authors' organizations

Author(s)
enter full name, e-mail address, mobile phone and affiliation(s) of the Author(s).
Check the Author who will present (only 1 choice)

Accept the agreements



3

Title:
enter the title of the Abstract
(max. 25 words)

Abstract:
enter the text of the Abstract
(max. 300 words)

Use this space if you need to report any notes

Neuroimmune Interaction: Bridging Neuroscience and Immunology

Upload Abstract

Abstract successfully submitted

Your Abstract has been submitted correctly. Acceptance will be notified by email.

The Italian Society for Neuroscience (SINS) is pleased to present the second workshop of the Dialogues on Brain Health series, continuing our commitment to fostering cutting-edge knowledge, interdisciplinary dialogue, and innovation in neurological and mental health.

This second appointment, titled "Neuroimmune Interaction: Bridging Neuroscience and Immunology", will take place on November 11, 2026, at the historic Aula Volta of the University of Pavia.

Once considered an immune-privileged organ isolated from peripheral immunity, the brain is now understood to exist in a constant, dynamic dialogue with the immune system. This workshop explores the complex neuroimmune crosstalk that regulates central nervous system homeostasis, functioning, and disease trajectory.

Bringing together leading national and international experts, the scientific program delves into the pivotal role of immune mechanisms across a broad spectrum of neurological and psychiatric conditions. Topics will range from fundamental mechanisms at brain borders and neuroinflammatory pathways to practical translational insights into autoimmune encephalitis, mood disorders, epilepsy, peripheral nervous system conditions, and movement disorders. Deciphering these neuroimmune interactions is essential to uncovering novel therapeutic targets, improving biomarkers for early diagnosis, and ultimately enhancing patient outcomes.

As with our inaugural event, the program features a 2-hour Poster Session (accompanied by a light lunch), offering young researchers an invaluable opportunity to showcase their work, build networks, and engage directly with established leaders in the field.
